

Keeping mercury out of your home

Mercury (chemical symbol Hg) is a poisonous, heavy metal. It is also known as quicksilver, because it is the only metal that is liquid at room temperature.

Mercury occurs naturally in the environment, and everyone is exposed to very low levels in air, water, and food. But exposure to higher doses of mercury can harm your health. Mercury is especially harmful to the developing nervous system of a fetus or young child, as they are much more sensitive to mercury than adults. Mercury can permanently alter the developing nervous system.

Why is mercury a health concern?

Breathing mercury vapor that has been released when mercury is spilled or mercury-containing products break is another source of exposure. Inhalation of mercury vapor can be dangerous, so it is important to prevent spills and clean them up immediately if they do happen.

Mercury can be found in many household items. Some of the more common items are:

- Thermostats (wall thermostats for heating and cooling)
- Compact fluorescent lightbulbs
- Thermometers (fever and cooking)
- Clothes irons (with 15 minute automatic shut off)

How can I reduce mercury exposure in my home?

The best way to protect you and your family from mercury exposure is to remove mercury-containing products and devices from your home.

- **Buy mercury-free products for use in your home.** New York State law requires that all mercury-containing products be labeled as such. Mercury-free alternatives are available for any product that would be used in the home.
- **Stop using and if necessary replace mercury products that can break and cause exposure.** If you have items such as thermometers, barometers, etc. that are easily broken or release mercury when used, stop using them and take them to your local household hazardous waste facility for proper disposal. Replace them with mercury-free alternative products.
- **Conserve energy.** Using less energy at home will not only save you money, it will also help reduce mercury pollution. When electrical power plants burn coal, trace amounts of mercury from the coal are released to the atmosphere. Conserving energy reduces the amount of coal that power plants burn.
- **Properly store and dispose of mercury-containing products and devices.** State law requires the recycling of all mercury-containing items. Take all compact and other fluorescent bulbs (i.e. CFLs), and other mercury-containing items to the nearest household hazardous waste collection site to be recycled. Please visit the Schenectady County Hazardous Waste Program Website for more information on disposal options at <https://www.schenectadycounty.com/HazMatDisposal>.

NEVER DUMP MERCURY CONTAINING MATERIALS DOWN THE DRAIN

What do I do if a mercury-containing device breaks or spills at home?

Call the New York State Department of Environmental Conservation Spills Hotline at: **(800) 457-7362** or visit the New York State Department of Health Mercury Clean Up and Disposal Website at <https://www.health.ny.gov/environmental/chemicals/mercury/cleanup.htm>.
